ABSTRACT OF THE DISCLOSURE

A method for increasing the speed at which data items are processed. The method receives electronic representations of data items and organizes the data items into separate groupings. The method next displays a particular grouping of data items to a resolver so that the resolver can evaluate the data items. In displaying the data items, the method uses a matrix of cells and displays one data item in each of the cells. The resolver can thus simultaneously view multiple data items, which facilitates efficient evaluations of the data items.
